Opportunity Meets Necessity: The Essential Case for Genuine Carbon Impact Investing

KEY POINTS

1. We believe this is an opportune time to invest in growth companies driving the transition to a lower carbon economy amid a confluence of macroeconomic, regulatory and market factors.
2. Unprecedented levels of investment and innovation in climate startups in recent years has led to a deep and maturing pipeline of highly attractive, decarbonization focused growth-stage companies.
3. Asset owners and investment managers must be willing to think creatively about traditional fund mechanisms to meaningfully address decarbonization on a global scale.

What We Are Seeing

Valuations are rationalizing as investors react to higher inflation, higher cost of debt and geopolitical disruption. This shift has driven away many shorter-term participants from the climate space, leaving key innovators requiring capital and operational input at a critical point in their growth trajectories.

European countries have learned that reliance on imported fossil fuels can be politically and economically harmful. Energy transition is not the sole solution to these problems, but greater control of energy supplies provided by renewables is undoubtedly beneficial.

Despite a boom in climate-focused funds, the bulk of money has been raised either in more mature buyouts or in the early-stage space, opening a gap in the middle that we intend to capture. The climate impact growth space remains relatively underserved, meaning innovative companies maturing from the early stage are sometimes overlooked or underfunded.

Opportunities for investment in carbon abatement solutions are plentiful and highly necessary. The UN estimates that \$125 trillion of climate investment is needed by 2050 to reach net zero. To achieve this, investment from now until 2025 must triple compared to the last 5 years.¹

What We Are Doing

The mobility sector directly accounts for 14% of global emissions and needs to detach growth from fossil fuel usage.² Encouragingly, the following four key themes are developing, each creating opportunities for innovative, growth-oriented companies: We are being more cautious about transportation, but we believe there is potential for favorable positive performance in 2023. We are likely to see a moderation in the rate of growth for transportation companies, but it's unlikely they will decline in an absolute sense. Airports continue to be busy, and we don't anticipate a significant drop in volume, but there may be a moderation in the rate of growth.

- **Electrification:** The shift of powertrains across the automotive, rail and shipping industries will drive systemic change in supply chains, infrastructure and end-of-life processes.
- **Connectivity:** Connected vehicles unlock capability improvements, information systems and live monitoring of performance metrics across consumer and industrial use cases.
- **Autonomy:** Unassisted transportation — that is, with no human backup — will meaningfully change how vehicles are viewed and used, and how they interact with the surrounding environment.
- **Smart Mobility:** Mobility-as-a-Service (MaaS) offerings are creating new use cases for vehicles and transport services.

Electricity, heat, and other energy production account for about 35% of global emissions.² Macro drivers — for example, population growth and increasing energy use per capita — point to an inexorable rise in energy demand that must be served by affordable, zero-carbon energy generation. This creates opportunities to roll-out existing renewable energy technologies, such as wind and solar, and to spur innovation to help overcome obstacles in renewable energy adoption.

Deteriorating agricultural land, rising populations, government regulations, and changing consumer preferences increase demand for more food, healthier options, and better practices for the environment. Agriculture, forestry, and other land use account for nearly 25% of global emissions.² Historically, the food and agriculture sector hasn't benefited as much from capital and innovation as the mobility and energy sectors. However, that has changed with unprecedented levels of funding flowing into innovative solutions that are enabling a more sustainable food system. As those solutions mature, we see ample opportunity to support companies up and down the value chain.³

What We Are Watching

Climate discussion has mainly centered around supply-side dynamics. We see huge potential for emissions avoidance on the demand side by making better use of the materials we have already produced. Employing circular economy models that reduce our consumption of natural resources has the potential to cut global emissions by 39% by 2032⁴ and to unlock \$4.5 trillion of economic output by 2030.⁵ This opportunity is amplified by the powerful convergence of certain structural macroeconomic drivers, creating potentially compelling investment opportunities across sustainable fashion, packaging, building materials and advanced recycling.

At the early growth stage, venture capital (VC) investors are taking vital risks to scale the technologies required to avoid a climate catastrophe, ranging from net-zero cement and sustainable building materials to hydrogen aviation and alternative infrastructure systems. Innovation is necessary, but the success of these companies will be predicated on their ability to sustainably raise and deploy capital. We consistently see and engage with a strong pipeline of opportunities from the early-stage space, relying on our methodology to identify those with genuine carbon impact potential.

The challenging fundraising environment forces many high-growth companies to accept lower valuations in order to raise required capital. We have seen companies with previously eye-watering valuations come down to investable ranges. Companies are more willing to accept investor-friendly deal structures, which could enable us to negotiate for terms such as liquidation preferences, drag-along rights and anti-dilution rights — presenting the potential for an even more attractive risk-return profile.

Private Capital dry powder remains at record levels of \$3.6 trillion,⁶ which should sustain high transaction volumes across the private markets landscape, including private equity. Amid continued competition for quality assets, deal origination at attractive value-at-entry levels is not a given. General partners (GPs) must remain selective and disciplined to create value for their limited partners.

Risk Considerations: *Historical performance information is not indicative of future results. Alternative investments are speculative and include a high degree of risk. Investors could lose all, or a substantial amount, of their investment. Alternative instruments are suitable only for long-term investors willing to forgo liquidity and put capital at risk for an indefinite period of time. Alternative investments are typically highly illiquid—there is no secondary market for private funds, and there may be restrictions on redemptions or the assignment or other transfer of investments in private funds. Alternative investments often utilize leverage and other speculative practices that may increase volatility and risk of loss. Financial intermediaries are required to satisfy themselves that the information in this document is suitable for any person to whom they provide this document in view of that person's circumstances and purpose. Morgan Stanley Investment Management (MSIM), its affiliates and its and their respective directors, officers, members, partners, employees, agents, advisors, representatives, heirs and successors shall have no liability whatsoever with respect to any person's or entity's receipt, use of or reliance upon this document or any information contained herein. If such a person considers an investment, she/he should always ensure that she/he has satisfied herself/himself that she/he has been properly advised by that financial intermediary about the suitability of an investment.*

"Despite a boom in climate-focused funds in recent years, the bulk of money has been raised either in more mature buyouts or in the early-stage space, opening a gap in the middle that we intend to capture. The climate impact growth space remains relatively underserved, meaning innovative companies maturing from the early stage are sometimes overlooked or underfunded."
