Emerging Markets Debt

Emerging Markets Debt Declines on Rising Rates, Ukraine Conflict and China Property

Boston - Emerging markets debt indexes fell across the board during the first quarter, as investors took stock of the Russian invasion of Ukraine, further stress in the China property market and the rate-hike plans of an increasingly hawkish U.S. Federal Reserve.

However, EM investors clearly differentiated within the sector. Russian, Belarussian and Ukrainian assets were generally the hardest hit, with Russian sovereign bonds being removed from the indexes as of the end of the quarter. Geopolitical concerns also depressed Eastern European markets.

At the other end of the spectrum, assets in Latin America and South Africa were generally stronger. Investors tended to perceive countries physically distant from the conflict —with notable commodity exports and limited trade with Russia — as being attractive. Asian markets were more mixed but generally sold off, influenced by ongoing contagion across the Chinese property sector.

- EM local-currency debt lost 6.46%. Foreign currencies, led by Latin America and South Africa, gained against the U.S. dollar during the quarter, but that was overwhelmed by losses from rising interest rates.
- Dollar-denominated, hard-currency debt lost more than 10%, hurt by exposure to U.S. rates and sovereign spread widening, which was sparked by the Russia/Ukraine conflict and China property concerns.
- Corporate EM debt lost 8.82%, hurt by U.S. rate increases. Wider corporate and sovereign spreads also had a negative impact on performance.

War and rising rates were a double whammy for EM debt

"We believe that focusing on country-level macroeconomic and political research — along with standalone analysis of specific risk factors such as currency, credit spreads and interest rates — represents the best approach for capitalizing on today's uncertainty in EM debt."

Index performance recap

Q1 2022

Sources: JP Morgan, Eaton Vance as of March 31, 2022. The vertical axis reflects the amount contributed by each factor to total return — adding the bars above 0% and below 0% (negative numbers) results in the total return in the headline. **FX** is the gain or loss in the GBI-EM from currency changes relative to the U.S. dollar. **EURUSD** reflects the portion of currency movement in the GBI-EM that is explained by the change of the euro (EUR) versus the U.S. dollar (USD). **Rates** refers to the contribution of change in local-currency interest rates in the GBI-EM. **Carry** refers to the risk-free returns in each GBI-EM country that cannot be attributed to FX, EURUSD or rates. **Sovereign Credit Spread** refers to the spread above U.S. Treasuries in the EMBI paid by a country. **Corporate Credit Spread** is the spread above the sovereign spread paid by an EM corporate issuer. **U.S. Treasury** refers to the contribution to return in the EMBI and CEMBI (both dollar-denominated indexes) due to interest-rate changes on the U.S. Treasury.

Looking ahead

Looking forward to the remainder of 2022, we are optimistic on EM debt, as valuations appear to be well-compensating investors for the risk.

The Russia/Ukraine war is a humanitarian tragedy that carries implications for the world order well beyond the scope of this blog, and it will continue to drive headlines — potentially for quite some time.

Fundamentals are mixed: generally speaking, commodity exporters are in better shape while importers are more challenged. Fed tightening is a concern, but markets appear to be pricing that in somewhat aggressively. COVID appears to broadly be less of a concern albeit with notable exceptions — for example, China

bonds with maturities of more than one year issued by emerging markets governments.

J.P. Morgan Corporate Emerging Market Bond Index (CEMBI) Broad Diversified is an unmanaged index of USD-denominated emerging market corporate bonds.

Investing entails risks and there can be no assurance that any strategy will achieve profits or avoid incurring losses. It is not possible to directly invest in an index. Past performance does not predict future results.

The value of investments may increase or decrease in response to economic and financial events (whether real, expected or perceived) in the U.S. and global markets. Investments in foreign instruments or currencies can involve greater risk and volatility than U.S. investments because of adverse market, economic, political, regulatory, geopolitical, currency exchange rates or other conditions. Investments in debt instruments may be affected by changes in the creditworthiness of the issuer and are subject to the risk of nonpayment of principal and interest. The value of income securities also may decline because of real or perceived concerns about the issuer's ability to make principal and interest payments. As interest rates rise, the value of certain income investments is likely to decline.
